

Colorado Cannabis Grower Experience

- These pictures were taken on the same day in June 2018 by a grower in Colorado.
- The images show an indoor grow with a “yellow sticky trap card”, which attracts and captures fungus gnats. Their larvae eat roots and other organic matter, which in turn reduces the ability of the plant to uptake and process nutrients.
- These cards are tools the grower uses to determine a course of action based on the number of captures, which indicate the severity of infestation.
- The image on the left shows the trap card next to plants that HAVE NOT been treated with BAM-FX.
- The image on the right shows the trap card next to plants that HAVE been treated with BAM-FX.
- These trap cards demonstrate how using BAM-FX can improve overall plant quality and also allow for the reduction of inputs in a number of areas including IPM (integrated pest management).
